PRODUCT INFORMATION SHEET

Monoclonal antibodies detecting human antigens

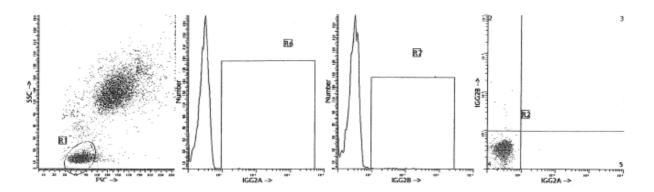

Isotype cont IgG2a	FITC	Isotype control IgG2b	R-PE	RUO	REF	IQP-276FR	50 tests		
RUO For Research Use Only									
	Description								
	IgG2a	Clone	MCG2a	Isot	type IgG2a	I			
	IgG2b	Clone	MCG2b	Iso	type IgG2t)			
Intended use	ended use Isotype controls are used to detect any non-specific binding, as well as binding mediated b interaction with Fc receptors using flow cytometry.								

Applications Analysis of non-specific binding in flow cytometry.

Usage All these reagents are effectively formulated for direct immunofluorescent staining of human tissue for flow cytometric analysis using $10 \ \mu l/10^6$ leukocytes for singles and $20 \ \mu l/10^6$ leukocytes in case of dual and triple combinations. Since applications vary, each investigator should titrate the reagent to obtain optimal results.

Representative Data

Staining with clone MCG2a (IgG2a) conjugated with FITC together with MCG2b (IgG2b) conjugated with R-PE is illustrated by flow cytometry analysis of normal blood cells. Direct staining was performed using 20 μ l of the dual and 100 μ l blood sample.

Limitations

- 1. Conjugates with brighter fluorochromes, like PE and APC, will have a greater separation than those with dyes like FITC and CyQ. When populations overlap, the percentage of positive cells using a selected marker can be affected by the choice of fluorescent label.
- 2. Use of monoclonal antibodies in patient treatment can interfere with antigen target recognition by this reagent. This should be taken into account when samples are analyzed from patients treated in this fashion. IQ Products has not characterized the effect of the presence of therapeutic antibodies on the performance of this reagent.
- 3. Reagents can be used in different combinations, therefore laboratories need to become familiar performance characteristics of each antibody in relation with the combined markers in normal and abnormal samples.
- 4. Reagent data performance is based on EDTA-treated blood. Reagent performance can be affected by the use of other anticoagulants.

Reagents and materials required but not supplied

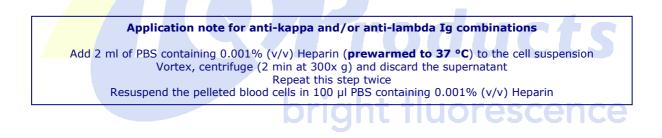

- 1. Flow cytometer
- 2. Flow cytometry disposable 12 x 75-mm capped polystyrene test tubes
- 3. Micropipette with disposable tips
- 4. Vortex mixer
- 5. Centrifuge
- 6. IQ Lyse erythrocyte lysing solution (IQP-199)
- 7. IQ Starfiqs fixation and permeabilization solution (IQP-200)
- 8. PBS (phosphate-buffered saline)
- 9. 1% Heparin
- 10. 1% paraformaldehyde solution in PBS (store at 2-8 °C in amber glass for up to 1 week)

Immunofluorescence staining and lysing protocol

Flow cytometry method for use with dual and triple combinations

- Add 100 μl of EDTA-treated blood (i.e. approx. 10⁶ leukocytes) to a 5 ml reagent tube. The content of one tube is sufficient to perform one test.
 - For combinations with anti-kappa and/or anti-lambda Ig see application note below.
- 2. Add to each tube 20 µl of labeled monoclonal antibody combination.
- 3. Vortex the tube to ensure thorough mixing of antibody and cells.
- 4. Incubate the tube for 15 minutes at room temperature in the dark.
- 5. Add 100 µl of IQ Lyse (IQP-199 ready-to-use) and mix immediately.
- 6. Incubate for 10 minutes at room temperature in the dark.
- 7. Add 2 ml of demineralized water and incubate for 10 minutes in the dark.
- 8. Centrifuge the labeled cell suspension for 2 minutes at 1000 x g.
- 9. Remove the supernatant and resuspend the cells in 200 µl of PBS*.
- 10. Analyze by flow cytometry within four hours (alternatively, the cells may be fixed by 0.05% of formaline in buffered saline for analysis the next day. Some antigens are readily destroyed upon fixation and this should be taken into account when using this alternative).

* PBS: Phosphate Buffered Saline, pH 7.2

Handling and Storage

Antibodies are supplied either as 100 tests per vial (1 ml) for singles or 50 tests per vial (1 ml) for dual and triple combinations. They are supplied in 0.01 M sodium phosphate, 0.15 M NaCl; pH 7.3, 0.2% BSA, 0.09% sodiumazide (NaN₃). Store the vials at 2-8 °C. Monoclonal antibodies should be protected from prolonged exposure to light. Reagents are stable for the period shown on the vial label when stored properly.

Warranty Products sold hereunder are warranted only to conform to the quantity and contents stated on the label at the time of delivery to the customer. There are no warranties, expressed or implied, which extend beyond the description on the label of the product. IQ Products is not liable for property damage, personal injury, or economic loss caused by the product.

Characterization

To ensure consistently high-quality reagents, each batch of monoclonal antibody is tested for conformance with characteristics of a standard reagent. Representative flow cytometric data is included in this data sheet.

Warning All products contain sodiumazide. This chemical is poisonous and hazardous. Handling should be done by trained staff only.
